Agile Backlog Creation & Sprint Simulation in Jira

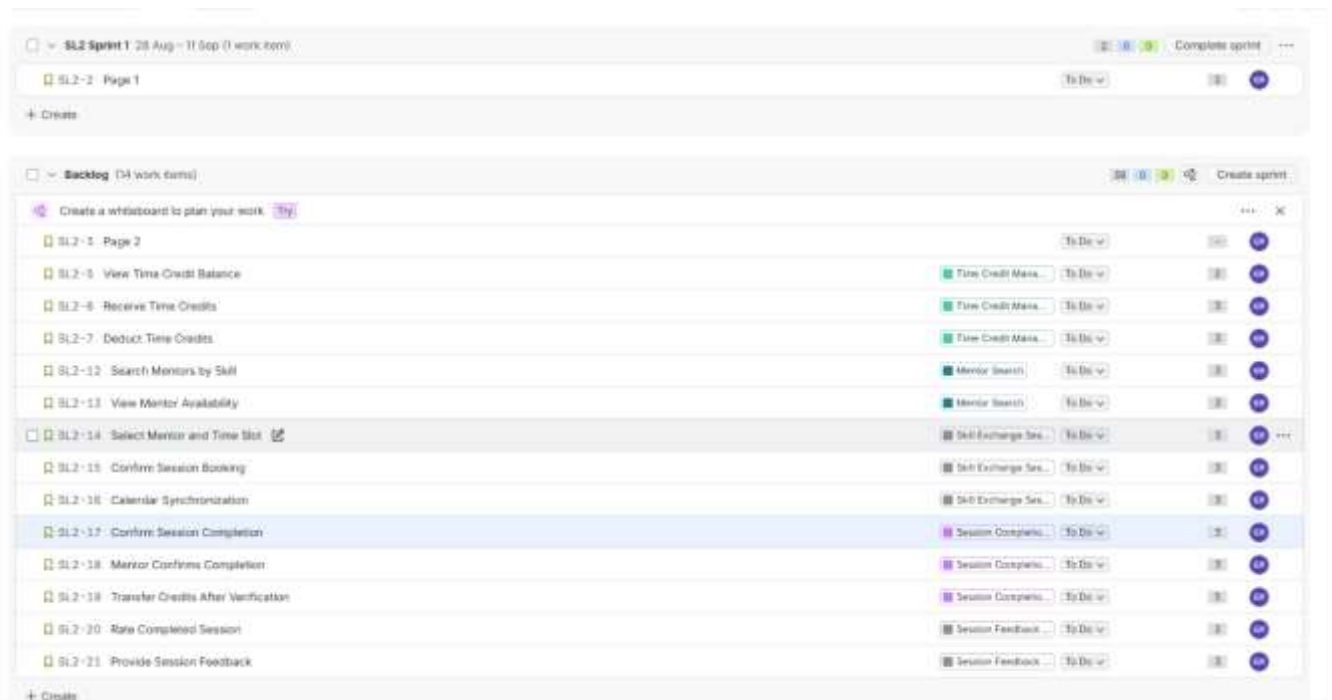

SRN: PES1UG24CS665

NAME: GAGAN R

SECTION: K

Sprint 1:

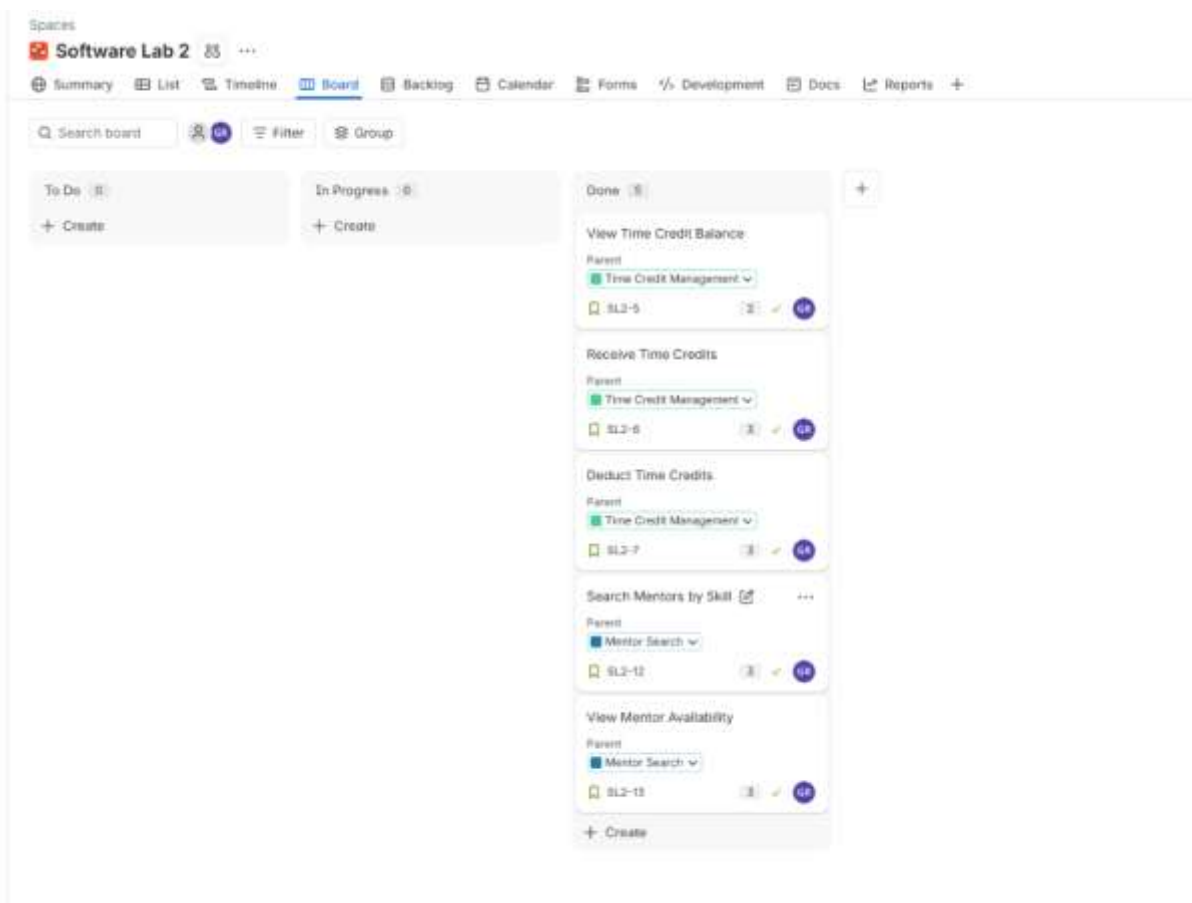

1)

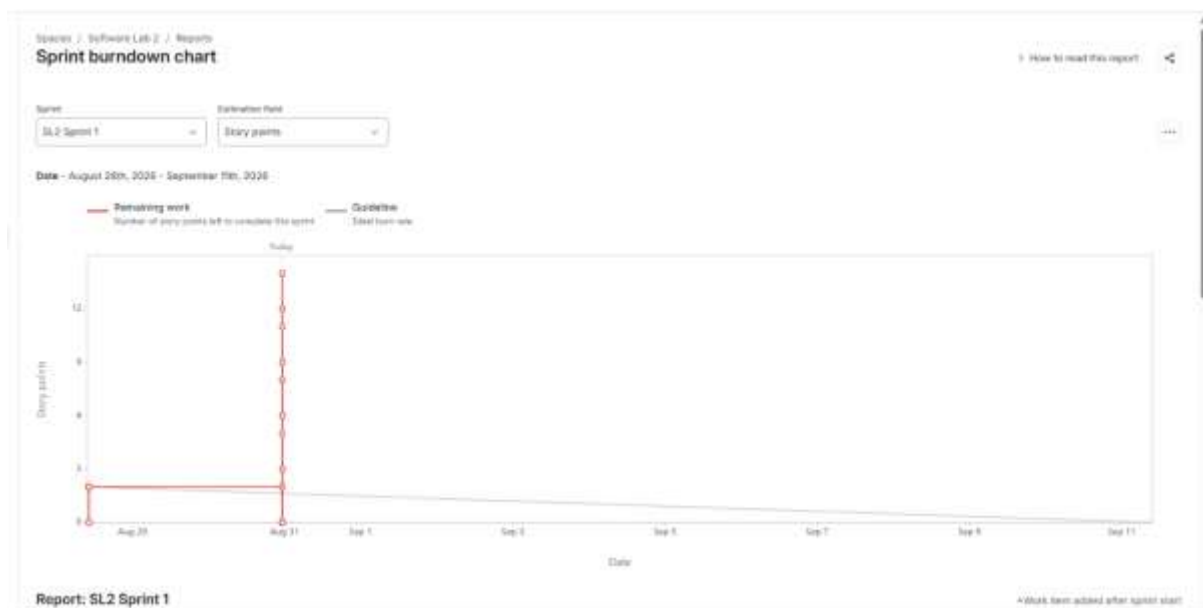

2)

3)

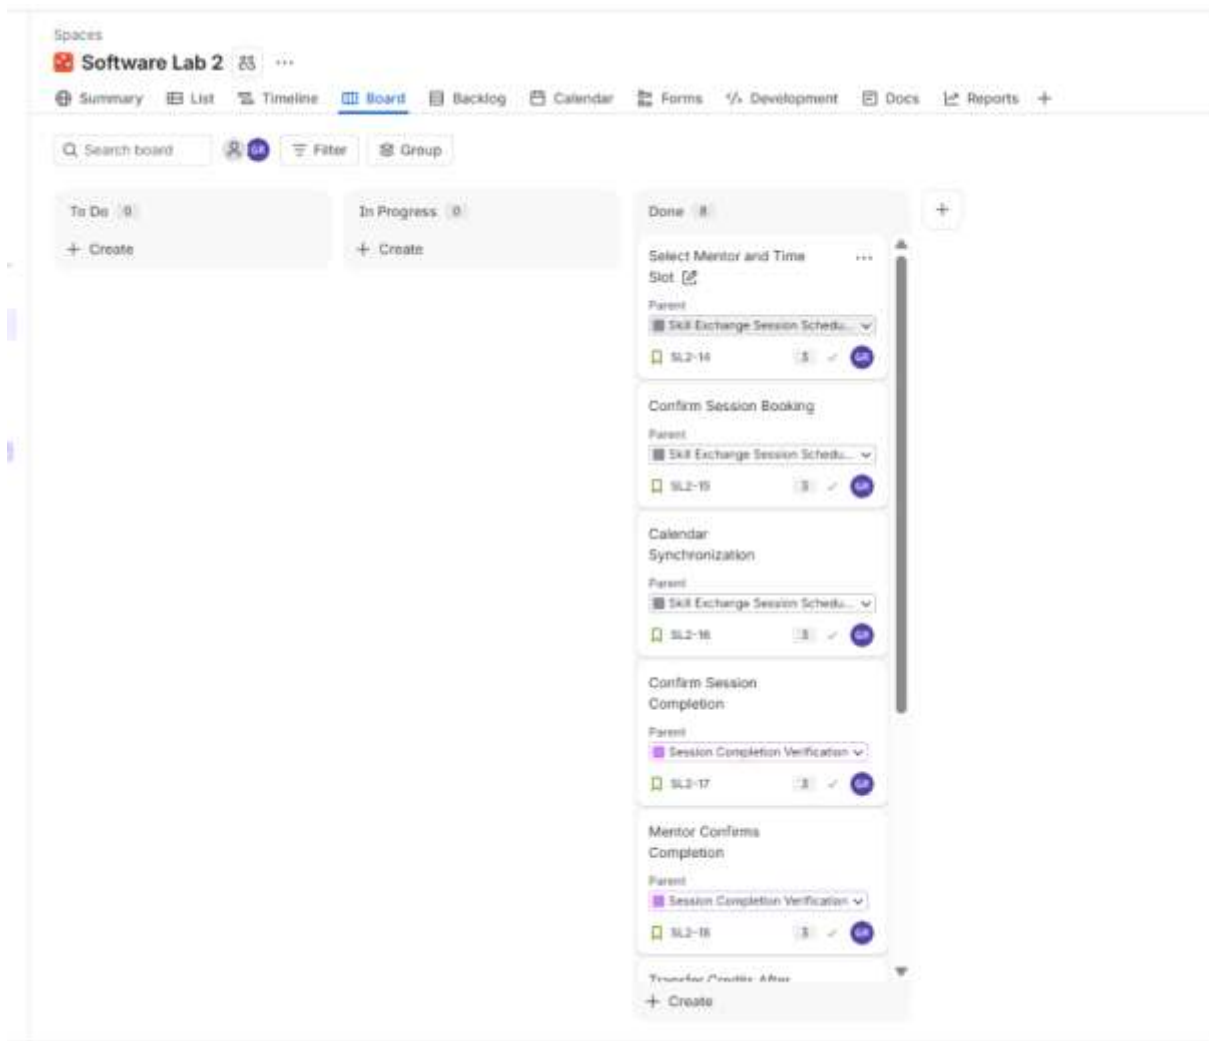

4)

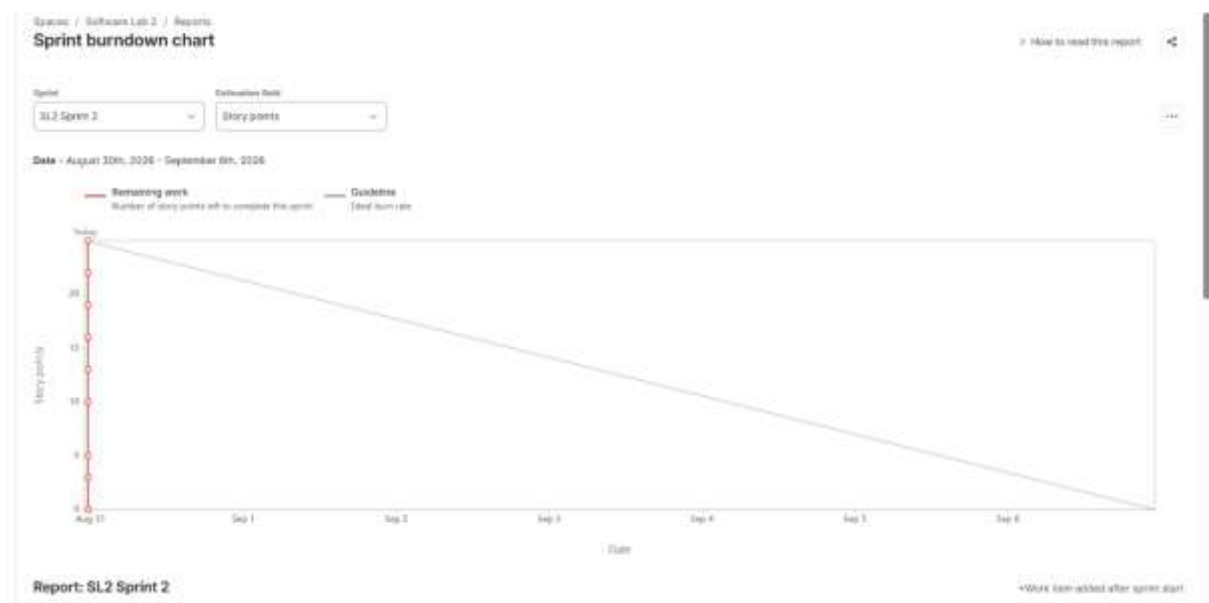

5)

2)

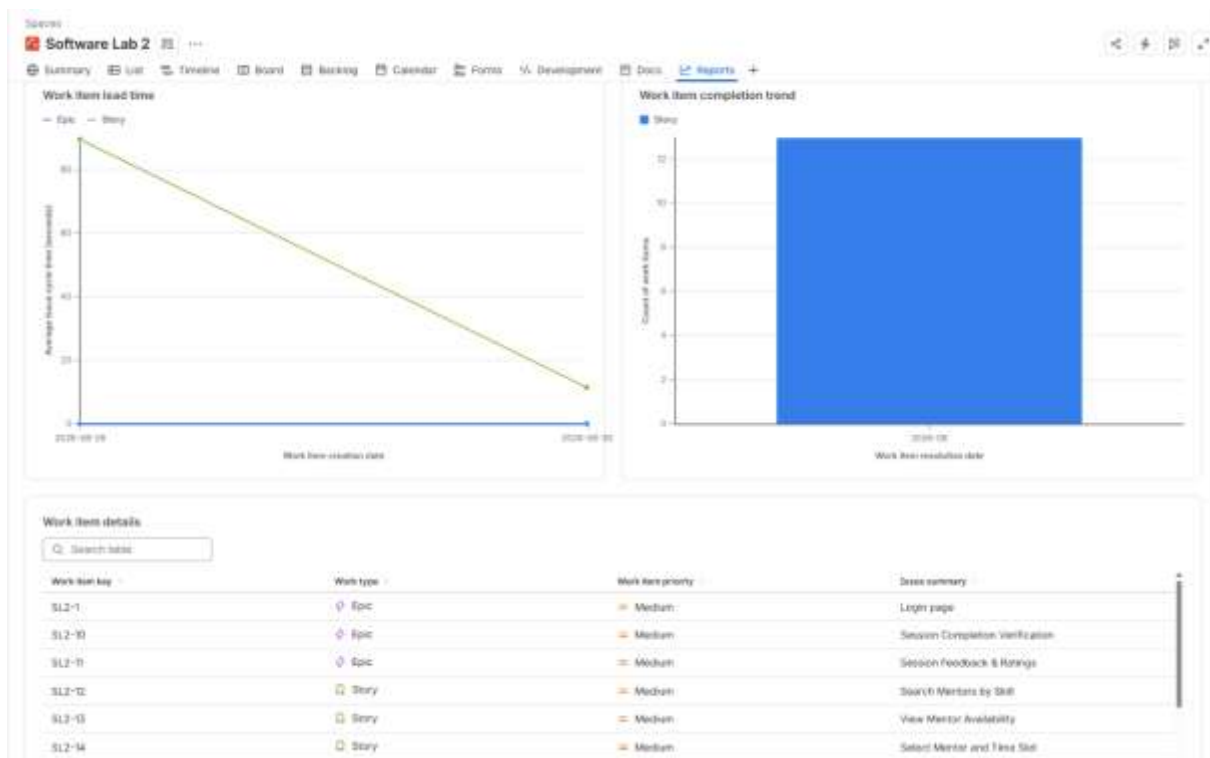

3)

4)

5)

Reflection Questions:

1. Did your estimations reflect the actual effort?

Yes, the estimations were reasonably close to the actual effort required. The stories were assigned story points based on their expected complexity. Since all the planned stories were completed within the sprint, the estimates were generally suitable, although some tasks may have required more or less effort than initially expected.

2. Was your backlog well-prioritized?

Yes, the backlog was prioritized based on the functional flow of the system. Core features such as time credit management, mentor search, session scheduling, session completion, and feedback were organized so that dependent activities could be completed in a logical order.

3. How did your simulated sprint align with your plan?

The simulated sprint aligned well with the plan because the selected stories were completed during the sprint. The stories progressed from **To Do → In Progress → Done**, and all 8 planned stories were completed. This shows that the sprint scope was achievable within the planned capacity.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed that the team was able to complete the planned 25 story points. The chart also showed

that much of the work was completed around the same period rather than being gradually completed throughout the sprint. This indicates that the team had sufficient capacity for the selected workload, but in a real project, spreading the work more evenly across the sprint would provide better visibility of progress and reduce the risk of last-minute completion.
